

## SD-WAN

### Modernising enterprise connectivity for a cloud-centric world

Organisations require trusted partners who deliver outcomes that scale with demand and integrate seamlessly. CACI enables this by providing certified professionals and expert teams across network, cloud, security and IT infrastructure.

SD-WAN applies a centralised, software-defined control model to WAN infrastructure. Intelligent traffic steering, transport independence and zero-touch provisioning simplify operations and reduce costs.

Support is provided for organisations modernising branch connectivity, improving application performance, strengthening security at the network edge and reducing the complexity of managing distributed networks. The approach ensures compliance, resilience and operational efficiency.

#### What CACI delivers

Conduct a detailed review of existing WAN infrastructure, application traffic flows and business requirements to identify key challenges, compliance needs and strategic objectives.

Develop a tailored high-level and low-level design, defining the optimal network topology, security framework, traffic policies and phased migration strategy.

Provide independent analysis of leading SD-WAN platforms to support selection of the right solution for technical and commercial needs. Partnerships with vendors such as Cisco and Fortinet bring deep expertise in deploying and managing secure, compliant platforms.

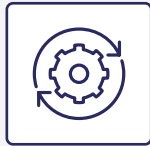

Certified engineers manage the full implementation lifecycle, including staging, installation, configuration and service cutover, ensuring minimal disruption and adherence to operational standards.

Comprehensive documentation and early life support ensure operational teams are confident in managing the new environment.

## Benefits of using CACI

Reduce WAN operational and circuit costs

Improve application performance and user experience

Enhance network security with unified policy frameworks

Simplify WAN management and accelerate deployments

Increase agility and responsiveness to business needs

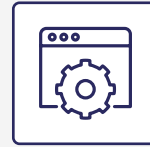

Gain visibility into traffic and application health

Enable secure and compliant cloud transitions

Improve network resiliency and uptime

Support regulatory obligations and audit readiness

## How it works

CACI's expert network consultants and engineers evaluate WAN infrastructure and align with goals for performance, security, compliance and efficiency. Bespoke SD-WAN solutions are designed and implemented using centralised orchestration, secure access service edge and intelligent path control.

Experience in delivering IT and network infrastructure enables transformation of legacy WAN environments into agile, cost-effective and high-performance network fabrics that securely connect users to applications, wherever they reside.

## About CACI

We help organisations improve outcomes through the enhanced use of technology and business processes. Our experts have architected, designed and built some of the UK's largest enterprise networks and data centres. We are goals-centric, identifying challenges and delivering results.

Our clients trust us to deliver on time and within budget, with minimal disruption and a focus on long-term value.
